

# Suspension systems for towing vehicles

- Increased ride-height
- More suspension travel
- Improved comfort
- Improved safety

## PROGRESSIVE SUSPENSION

The most cost effective solution to overcoming “sagging” rear suspension.

As you increase the load, secondary coil springs provide progressively more assistance improving towing safety and comfort.

Ride and handling are not affected when the towing vehicle is unladen.

Kits are vehicle specific and start from £67.00 INC VAT

## INTERACTIVE SUSPENSION

Interactive air suspension allows you to choose the level of suspension assistance according to the load and circumstances.

The system can be inflated either via a Schrader valve at any service station, or an optional on-board compressor allows inflation pressure to be changed on the move to achieve the optimum ride, comfort, ground clearance and safety.

*Optional on-board  
Compressor*

## AIR-LIFT SUSPENSION

If your vehicle is constantly loaded to near maximum rear axle capacity, the MAD Air-Lift system provides the ultimate assistance.

Air-Lift can be supplied with optional on-board compressor, or inflated from any service station.

*As fitted to every  
AA Patrol vehicle.*

Find out which kit suits your vehicle and your needs best by returning the enquiry form, or visit us at
